

CS 564: Database Management Systems

Lecture 2: SQL Basics I

Xiangyao Yu

1/26/2024

Module A1: SQL

SQL: Basics I

- Relational models
- Single-table operations

SQL: Basics II

Advanced SQL I

Advanced SQL II

Outline of this Lecture

Recap of Relational Model

SQL: Basics

- Creating a table

SQL: Single-table queries

- SELECT-FROM-WHERE structure
- DISTINCT/ORDER BY/LIMIT
- Aggregation

Recap of Relational Model

Relation: a table with rows and columns

Product

| name | category | price | manufacturer |
|---------|----------|----------|--------------|
| iPad | tablet | \$399.00 | Apple |
| Surface | tablet | \$299.00 | Microsoft |
| ... | ... | ... | ... |

The schema of a relation:

relation name + attribute names

Product (name, price, category, manufacturer)

Primary Key

A primary key is a selected **subset of attributes** that is a unique identifier of tuples in a relation

Product

| name | category | price | manufacturer |
|---------|----------|----------|--------------|
| iPad | tablet | \$399.00 | Apple |
| Surface | tablet | \$299.00 | Microsoft |
| ... | ... | ... | ... |

For example, **Product.name** can be the primary key

There can be only one primary key, but many unique keys

Accessing tuples using primary keys is preferable

Outline

Recap of Relational Model

SQL: Basics

- Creating a table

SQL: Single-table queries

- SELECT-FROM-WHERE structure
- DISTINCT/ORDER BY/LIMIT
- Aggregation

Structured Query Language (SQL)

Pronounced “sequel” or “S.Q.L.”

The most widely used database language

- Many standards: SQL-92, SQL:1999, SQL:2011, SQL:2016, SQL:2023

Data Definition Language (DDL)

- Creation, deletion, modification of definitions of tables

Data Manipulation Language (DML)

- Query
- Insert, delete, and update rows

SQL: Create a Table

table name

CREATE TABLE Product (

attributes

name **CHAR(30) PRIMARY KEY,**

category **CHAR(20),**

price **REAL,**

manufacturer **CHAR(20)**

);

Product

| name | category | price | manufacturer |
|---------|----------|----------|--------------|
| iPad | tablet | \$399.00 | Apple |
| Surface | tablet | \$299.00 | Microsoft |
| ... | ... | ... | ... |

“name” is the primary key

SQL: Create a Table — Unique Keys

```
CREATE TABLE Product (  
    pid INTEGER PRIMARY KEY  
    name CHAR(30) UNIQUE,  
    category CHAR(20),  
    price REAL,  
    manufacturer CHAR(20)  
);
```

“pid” is the primary key
“name” is a unique key

Insert to a Table

To insert a single tuple:

```
INSERT INTO <relation>  
VALUES ( <list of values>);
```

Product

| name | category | price | manufacturer |
|---------|----------|----------|--------------|
| iPad | tablet | \$399.00 | Apple |
| Surface | tablet | \$299.00 | Microsoft |
| ... | ... | ... | ... |

Insert to a Table

To insert a single tuple:

```
INSERT INTO <relation>  
VALUES ( <list of values>);
```

Product

| name | category | price | manufacturer |
|---------|----------|----------|--------------|
| iPad | tablet | \$399.00 | Apple |
| Surface | tablet | \$299.00 | Microsoft |
| ... | ... | ... | ... |

For example

```
INSERT INTO Product  
VALUES  
    ('iphone', 'phone', 999.00, 'Apple'),  
    ('chromebook', 'laptop', xxx, 'Google');
```

Example Database

sailors(**sid**: integer, **sname**: string, **rating**: integer, **age**: real)

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

← Primary Key

Example Database

sailors(**sid**: integer, **sname**: string, **rating**: integer, **age**: real)

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

```
CREATE TABLE sailors(  
    sid INTEGER PRIMARY KEY,  
    sname CHAR(20),  
    rating INTEGER,  
    age REAL  
);
```

```
INSERT INTO sailors VALUES  
(22, 'Dustin', 7, 45.0)
```

Outline

Recap of Relational Model

SQL: Basics

- Creating a table

SQL: Single-table queries

- SELECT-FROM-WHERE structure
- DISTINCT/ORDER BY/LIMIT
- Aggregation

Basic SQL Query

SELECT *attributes*
FROM *table*
WHERE *conditions*

Basic SQL Query

SELECT *attributes*
FROM *table*
WHERE *conditions*

Pseudo code for the SELECT-FROM-WHERE structure

Foreach row in *table*
 if *conditions* are satisfied
 send *attributes* in *table* to output

Example

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT sname
FROM Sailors
WHERE rating > 7;
```

Output

| sname |
|--------|
| Lubber |
| Andy |
| Rusty |
| Zorba |
| Horato |

* in Select Clauses

When there is one relation in the **FROM** clause, * in the **SELECT** clause stands for “*all attributes of this relation*”

```
SELECT *  
FROM Sailors  
WHERE rating > 7;
```

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

Output

| sid | sname | rating | age |
|-----|--------|--------|-----|
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Renaming Attributes

If we want the output schema to have different attribute names, we can use **AS** *<new name>* to rename an attribute

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT sname AS SailorName
FROM Sailors
WHERE rating > 7;
```

Output

| SailorName |
|------------|
| Lubber |
| Andy |
| Rusty |
| Zorba |
| Horato |

Arithmetic Expressions

We can use arithmetic expression in the **SELECT** clause

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT sname,  
       (60 - age) AS YearToRetire  
FROM Sailors  
WHERE rating > 7;
```

Output

| sname | YearToRetire |
|--------|--------------|
| Lubber | 5 |
| Andy | 35 |
| Rusty | 25 |
| Zorba | 44 |
| Horato | 25 |

What can we use in WHERE Clauses?

Attribute names of the relations that appear in the **FROM** clause

Comparison operators: =, <>, <, >, <=, >=

Arithmetic operations: (+, -, /, *)

AND, OR, NOT to combine conditions

Operations on strings (e.g. concatenation)

Pattern matching: *s* **LIKE** *p*

Special functions for comparing dates and times

Pattern Matching

s **LIKE** p: pattern matching on strings

% = any sequence of characters

_ = any single character

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT *  
FROM Sailors  
WHERE sname LIKE '%st%';
```

Output

| sid | sname | rating | age |
|-----|--------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 58 | Rusty | 10 | 35 |

AND, OR, NOT

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT *  
FROM Sailors  
WHERE sname LIKE '%st%'  
      OR age > 50;
```

Output

| sid | sname | rating | age |
|-----|--------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 58 | Rusty | 10 | 35 |
| 31 | Lubber | 8 | 55 |

Using Distinct

The default semantics of SQL allow duplicate tuples in the output

Use **DISTINCT** in the **SELECT** clause to removes duplicates

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT DISTINCT rating  
FROM Sailors;
```

Output

| rating |
|--------|
| 7 |
| 1 |
| 8 |
| 10 |
| 9 |

Order By

ORDER BY orders the tuples by the attribute we specify in **decreasing (DESC)** or **increasing (ASC)** order

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT sname, age
FROM Sailors
WHERE age < 35
ORDER BY age DESC;
```

Output

| sname | age |
|--------|-----|
| Brutus | 33 |
| Andy | 25 |
| Zorba | 16 |

Limit

LIMIT *<number>* limits the output to be a specified number of tuples

Usually used with **ORDER BY** to get the **top K** records

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

```
SELECT sname, age
FROM Sailors
ORDER BY age DESC
LIMIT 2;
```

Output

| sname | age |
|--------|-----|
| Lubber | 55 |
| Dustin | 45 |

Aggregation

SUM, AVG, COUNT, MIN, MAX can be applied to a column in a **SELECT** clause to produce that aggregation on the column

```
SELECT AVG(age)
FROM Sailors
WHERE rating > 4;
```

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

Aggregation: Example

Count the number of sailors

```
SELECT COUNT(*)  
FROM Sailors S;
```

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

Aggregation: No Duplicates

We can use

COUNT(DISTINCT <attribute>)

to remove duplicate tuples before counting!

```
SELECT COUNT (DISTINCT rating)
FROM Sailors;
```

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

Aggregation: Example

Find the age of the oldest sailor

```
SELECT MAX(S.age)
FROM Sailors S;
```

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

Aggregation: Example

Find the name and age of the oldest sailor

| sid | sname | rating | age |
|-----|---------|--------|-----|
| 22 | Dustin | 7 | 45 |
| 29 | Brutus | 1 | 33 |
| 31 | Lubber | 8 | 55 |
| 32 | Andy | 8 | 25 |
| 58 | Rusty | 10 | 35 |
| 64 | Horatio | 7 | 35 |
| 71 | Zorba | 10 | 16 |
| 74 | Horato | 9 | 35 |

Sailors

HINT: Use the output of one query (i.e., SELECT-FROM-WHERE) within another query

Activity-1b.ipynb

Summary

The Relational Model

- Tables, records/tuples/rows, attributes/fields/columns, schema, primary key

SQL: Basics

- DDL, DML, Creating a table, insert

SQL: Single-table queries

- SELECT-FROM-WHERE structure
- In SELECT: * in Select, rename attributes, arithmetic expressions, DISTINCT
- In WHERE: pattern matching, AND/OR/NOT
- ORDER BY, LIMIT
- Aggregation (e.g., SUM, COUNT, AVG, MAX, MIN)
